a Sign is decided by
$|\Delta_{conv}| > \Delta_{edge}$
above line = sign reverses (31/60)
below line = sign holds (29/60)
|Capture term| (pp)
Edge increment Δ_{edge} (pp)
sign reverses
sign holds
b Capture loss drives the
capture term (r = -0.98)
Δ_{conv} and capture loss are
collinear; Δ_{edge} is not
Δ_{conv} (pp)
Capture-loss rate (%)
Δ_{conv}
c Reversal occurs where the
baseline is already high
Arterial-only baseline reach (%)
76.4
